

Sample Peptide Consent

Background

Peptides are proteins and protein fragments that are made of amino acids. Peptides used for therapy are molecules that have been identified in humans and found to have a functional and regulatory part of human homeostasis and metabolism. Proteins and peptides are the final products of our DNA when its message is decoded and put to work in the cell and ultimately in our bodies. Therefore, peptide therapy is finding the best of these proteins that have been found in the body and synthesizing them and giving them back to us. As we age, we lose the efficiency of making these proteins and enacting the messages of our DNA. Peptide therapy can help supplement these protein and functional deficits in our bodies.

Drugs are generally proteins and peptides and molecules that are not made in our bodies or rarely made or found in our bodies but effect receptors and cause activity in our bodies. Peptide therapy makes these proteins and peptides that OUR body already uses and makes.

Peptides and Peptides Therapies have both FDA approved as well as FDA investigated as well as Experimental status. All of the peptides offered by Capitis Research Institute are FDA approved, or have been Approved for treating humans in Europe and Asia, and they have EXPERIMENTAL status in the United States.

Peptide: _____

Purpose: _____

Consent

In signing this, I acknowledge all risks and benefits were discussed with my medical provider before administration of the peptide. Additionally, I understand that any side effects will be immediately reported to my provider. I also agree to forego any legal action and am making my decision to receive peptide therapy on my own accord under no coercion with careful guidance of my medical provider and will not administer them in any other manner than discussed and agreed upon.
